Welcome to the Cuelux user's manual, this document describes the Cuelux software and the basics of lighting programming.

## **Table of Contents**

1 Overview
2 Installing Drivers
3 Options6
4 Patch9
5 Playbacks
6 Groups
7 Cuelists
8 Stacklists
9 Globals 21
10 Tempo Control 22
11 Hot-keys
12 MIDI Controllers Mappings
13 iPhone Remote
14 Personality Files
15 Personality Builder
Notes
Index

If, after consulting this manual, you still have questions then you can obtain additional information and help through the on-line support forum. Cuelux users and employees of Visual Productions share their experiences and tips on this forum. You can find the forum at http://www.visualproductions.nl/forum.

## 1 Overview

Cuelux is a DMX-512 lighting controller for intelligent lights, LED, dimmers, lasers and various other effects. The program is platform-independent and available on Mac OS X, Microsoft Windows and Ubuntu Linux. The software is shipped with a USB-to-DMX adapter cable. Key to the design of Cuelux is its intuitive graphical user-interface; it is specially designed to reduce the amount of time required to learn how to operate the software.

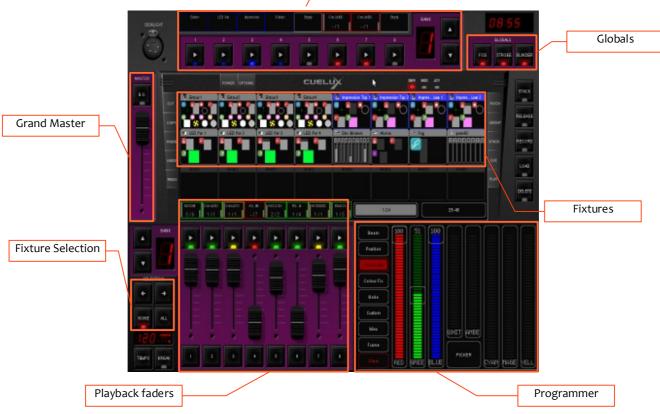

## **F**EATURES

- Mac OS X, Windows 7, Vista, XP & Ubuntu
- Industry standard cuelist system
- Plug & Play MIDI controller mapping
- 100% touch screen compatible
- 512 channels DMX512 + Art-Net
- 48 Fixtures (10 sub-fixtures per fixture)
- Unlimited cuelists and groups

- 64 playback faders + 64 buttons
- Shape generator
- iPhone remote
- Multi language

Playback buttons

- 2100+ Personality files
- 32-bit and 64-bit hardware drivers
- Editor for Personality-files

## **U**SER-INTERFACE

#### Cuelux Manual

## 2 INSTALLING DRIVERS

This chapter provides step-by-step instructions for installing the USB driver for the CueCable interface.

## 2.2 CUELUX ON MAC OS OR LINUX

Just connect the CueCable to a free USB port on your Apple or Linux computer; Mac OS and Linux do not require a specific driver for the CueCable.

## 2.1 CUELUX ON WINDOWS

Cuelux comes with drivers for both 64-bit and 32-bit versions of Windows XP, Vista and 7. The drivers are bundled with the application and copied to your computer by our installer tool. Please use this tool for installing the drivers and ignore any 'New Hardware Found' popup dialogs from Windows.

The installer will automatically detect whether your Windows system is 64-bit or 32-bit and select the appropriate drivers.

If you have already installed the driver before and you would just like to install an update for the Cuelux application then you can skip installing the drivers again.

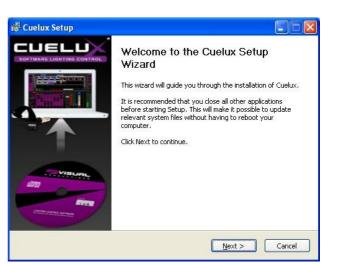

#### Installing under 64-bit

Follow the instruction in the installer-wizard. During the installation of the driver Windows might prompt you several times to confirm if you would like to install the driver from 'Jungo'; this is the name of the vendor of this specific driver. Please confirm that you would like to install this driver.

Illustration 1: CueCable

#### Installing under 32-bit

Please make sure your CueCable is connected to the computer for installing the 32-bit driver and follow the instructions on your screen.

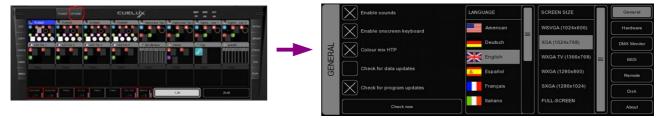

#### Verifying the driver

Run Cuelux and check in the OPTIONS -> HARDWARE that the CueCable is detected.

## **3 O**PTIONS

The Options menu enables you to change preferences and view various settings.

## General

This tab enables you to choose a language and a screen resolution.

Cuelux is updated regularly to provide you with improved features, bug-fixes and new or improved personality-files. To check for updates, click CHECK NOW . To have Cuelux check automatically at startup - only once a day – you should enable the CHECK FOR PROGRAM UPDATES check box.

The CHECK FOR DATA UPDATES check box enables Cuelux to automatically update its data files like personalities, languages and midi-maps. N.B. This feature is not yet operational in software version 1.03.18.

The COLOUR MIX HTP check box sets the HTP or LTP mode for the Colourmix RGB attribute. When enabled, the highest RGB Colour Mix value out of all active cuelists will be outputted. The "highest" colour is white (RGB 255,255,255). When disabled, the most recently changed value for RGB Colour Mix will be outputted (LTP).

## Hardware

In the hardware tab you can check that the CueCable is properly connected. You can also enable Art-Net (a protocol to send DMX data over the network). Art-Net is a very useful protocol to connect Cuelux to third-party visualizers (e.g. WYSIWYG or Capture Polar). The Art-Net protocol supports up to 256 universes whilst Cuelux only supports 1 universe, so the ARTNET UNIVERSE field allows you to select on which ArtNet universe Cuelux will broadcast its one and only universe. The default value is o.

Please take into account that the Art-Net feature is only enabled while a CueCable is connected.

	PCE version	1.3		Ocraral
	Firmware Version	1.83		Hathmay

	000	005	000	000	000	001	106	080	About

#### MIDI

Cuelux supports various MIDI control surfaces; it allows you to control Cuelux' user interface (UI) through the buttons and faders on the MIDI controller. The software ships with a list of predefined Midimaps. A midi-map file describes the MIDI controller and how its features (buttons, faders, etc) are mapped to the Cuelux UI.

To set up Cuelux for use with your MIDI controller, select the appropriate INPUT DEVICE and optionally an OUTPUT DEVICE. The output device is used by Cuelux to provide feedback to MIDI controller's LEDs and motorized faders. Then select the MAP that corresponds to your MIDI controller.

	NPUT DEVICE		OUTPUT DEVICE	HAP	$\square$	6+1+15
	Nó Through Port-0		Nick Through Peri-0	Partan Kilania Mui	]	Hardware
	manic ACONTROL MID 1		nano/cohmici, VID 4	Kong Mano Kely		DVIS Vien far
<u>e</u>		=		Korg Nano Karthol		IVIDI
2				Korg Nano Pad		Herrota
				Lived Otm84		GHA
			Batroph	Vi Audio Trigger Finger		

Please take into account that the MIDI controller needs to be connected to the computer before Cuelux starts up; Cuelux only scans for MIDI devices at start up. After that you would need to use the REFRESH button to scan again.

Please refer to page 24 for diagrams describing the layout of various Midi-maps. Also, an overview of all supported MIDI controllers can be found at the Cuelux website: http://www.cuelux.com/features/#midi

#### Remote

The Remote feature allows you to view the patch including addresses and dip-switch settings per fixture in real-time from your browser-enabled mobile device. It also allows you to trigger the playback-buttons remotely.

To connect your device to this webbased feature you would need to make sure that the checkbox is enabled and then type in your browser the exact address as displayed in the BROWSE TO field.

	Port	8988	Change	General
TOT				Hardware
CONTROL	Browse to	http://192.168.1.3:8888		DMX Monitor
111		Enable remote control		MIDI
REMOTH				Remote
RE				Disk
				About

Cuelux takes the IP address currently

assigned to the computer's network interface. You cannot change this address in Cuelux, that would need to be done in the computer's network settings. Please do take into account that Cuelux uses the first available network interface, if you have multiple (e.g. wired network and WIFI), there is no way of choosing which interface Cuelux uses. This means that sometimes you would need to disable one interface to force Cuelux to use the preferred interface.

Please refer to page 29 for step-by-step instructions for setting up this feature with an iPhone.

### Disk

The Disk tab allows you to load and save show-files. A show-file contains all information about the patch, playback assignments, cuelists, etc. You don't need to save your show-file as Cuelux will check for changes every few seconds and automatically save the file if needed.

	Current filename	/Users/maartenengels/VisualProductions/Cuelux/demo.xml	General
			Hardware
MENU			DMX Monitor
KME		New	MIDI
DISK		Open	Remote
			Disk
		Savo as	About

By saving manually and choosing a name for the show-file you can manage different lighting projects or create backup versions. The show-files are stored in XML format at the following locations:

C:\Documents and Settings\[username]\My Documents\Visual Productions\Cuelux
C:\Users\[username]\Documents\Visual Productions\Cuelux
/Users/[username]/Visual Productions/Cuelux
/home/[username]/Visual Productions/Cuelux

By copying the show-file you can easily transfer your show between different computers or even Operating Systems.

### About

This tab displays the software's version number.

## 4 Ратсн

The PATCH view allows you to setup the DMX fixtures which are connected to Cuelux.

## Add

Click ADD to open the Add Fixture dialog. Browse the manufacturers list, and choose the MANUFACTURER of the first fixture you would like to add.

To quickly find a manufacturer, start typing the name of the manufacturer you're looking for or your keyboard. While typing, the list will jump to the correct manufacturer in the list. Browse the MODELs for the selected manufacturer and choose one by clicking it. To quickly find a model

IFACTURER		MODEL	e	MODE	CHN		
I	8	Alpha Beam 1500		Standard	39		
vet		Alpha Beam 300		Vector	43		
nlech		Alpha Beam 700				=	
Paky		Alpha Profile 1200					$\frown$
		Alpha Profile 1500					Add
		Alpha Spot 700					Cancel
	IFACTURER I vet niech ⊃aky	vet	vet niech Paky Alpha Beam 700	vet inlech inlec	vet niech Saky Alpha Beam 700 Alpha Profile 1500	vet niech <sup>3</sup> aky Alpha Profile 1500 Jahra Profile 1500	vet niech Skard Sk

in a long list, click on the "model" list and start typing the name of the model you're looking for.

If you would like to choose a fixture that is not present in these lists then please refer to page 30 to see how to obtain new personality files.

## Remove

To remove one or more fixtures from the patch, select them in the Patch view by clicking or dragging and click REMOVE. To remove all fixtures, click REMOVE and keep the button pressed for at least 1 second.

## Replace

If you have pre-programmed a show with your fixtures, and find out these fixtures are running in a different mode or are even a completely different fixture when on location, the REPLACE tool can help you. Select the fixtures you would like to replace by clicking or dragging in the Patch view and click REPLACE. This will open the CHANGE FIXTURE dialog, which is similar to the ADD FIXTURE dialog. Choose another mode for the same model, or choose even another model.

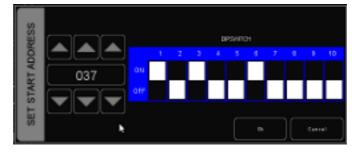

## Rename

To give your fixtures a more clear name, select 1 or multiple fixtures and press RENAME. Type a new name for the fixture and click OK or press <ENTER.>. If you've renamed multiple fixtures, Cuelux will automatically add 01, 02, 03 etc. to the name you have entered.

## Address

Cuelux automatically sets the DMX address when adding fixtures to the patch, by finding the first available DMX channel in your configuration. However, if you want to change the address, select 1 or multiple fixtures and click ADDRESS. Enter the new address and click OK.

If you had multiple fixtures selected, Cuelux will set the entered address for the first selected fixture and will automatically have the next selected fixtures follow the previous ones. For example, if you select 4 8-channel dimmers in the patch, click ADDRESS and enter "101". This will result in addresses 101, 109, 117 and 125 for the selected dimmers.

## **Properties**

Selecting a fixture and clicking on the PROPERTIES button will pop up the Fixture Properties window.

This window allows you to enable INVERT PAN, INVERT TILT and SWAP PAN TILT in case the fixture is a moving light.

If the fixture has RGB colour mixing but no DMX channel for intensity, you can enable VIRTUAL DIMMER. This option will give the fixture dimmer capability separate from the RGB control.

## **5** PLAYBACKS

Playbacks are an important element in a cuelist based lighting controller like Cuelux. Cuelists are not activated directly, instead they are assigned to a playback. The playback allows the user to start (give the playback a 'Go') and stop ('release' the playback) the cuelist, as well as controlling other parameters like intensity, speed, attack, etc. Playbacks can also contain stacklists and groups.

There are two types of playbacks, playback faders Illustration 3: Playback Buttons and playback buttons. They work in a similar way, the difference is that a playback button does not feature the intensity fader and the flash button. Therefor the playback button takes up less space in the Cuelux user-interface. Playback buttons are more suitable for controlling cuelists that have fixed-value attributes like fixed colours, gobo, prism and shutter. On the other hand, playback faders are better suited for controlling cuelists containing level-value attributes like dimmer, RGB colour, iris, strobe, etc.

## Assignment

You can assign a playback in three ways.

Firstly, you open the PLAY menu, select a cell corresponding to playback and press the ASSIGN button. The dialog that will pop-up guides you through selecting a cuelist, stacklist or group to assign to this playback. The PLAY menu also enables you to Copy/Paste and SWAP assignments.

Alternatively, you can double-click on the 'indicator' just above a playback to bring up the Playback Settings view. Pressing the ASSIGN button in this dialog will bring up the assignment dialog.

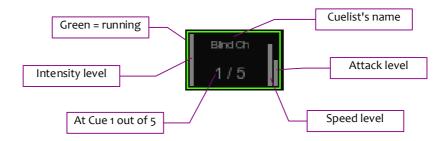

Finally, you can also assign by creating a new cuelist, stacklist or group in main view, this implicitly assigns the new cuelist, stacklist or group to a playback. Please refer to the Cuelist, Stacklist or Group chapter for an explanation on how this is done.

## Indicator

The small rectangle above the playbacks are called 'indicators', they provide some basic feedback on the contents of the playback.

## Background

If a playback is set to 'background' then it will start running automatically at the software's startup. Also, it will not be released by the 'release all' command (a 'release all' is performed when the RELEASE button is pressed for over one second).

The background feature is useful for cuelists controlling fixtures that should not be turned off during a show, e.g. 'work' lights backstage.

## Fader Start

With Fader start enabled, the playback will automatically be triggered when the corresponding fader is being moved up or the flash button is pressed. The playback will also be released as soon as the fader is back at the bottom or when the flash button is released.

### Bundle

You bundle playbacks together so they work mutually exclusive; i.e. only one playback is active at the same time. Whenever you start a playback it will automatically release any other playback in the same bundle. You can set up up to 20 different

bundles.

Bundles come in handy if you have a couple of playbacks controlling cuelists for the same fixtures, especially if those cuelists contain HTP attributes like dimmer.

			•		
NAL OF		1			
ave [					
-					
1					Canad

## Sub-masters

When you attach a Group to a playback button, the playback button allows you to quickly select the fixtures in that group. When attached to a playback fader, the PLAY-button of the playback fader acts as the selection button and the fader becomes a live intensity fader for the group.

## Banksafe

Some cuelists or sub-masters you will need to change so frequently, that you would like to access them from each bank. In the PLAY menu, you can achieve this quickly by selecting the playback's cell in the table and clicking BANKSAFE.

## 6 GROUPS

The Group menu enables you to create groups with fixtures and/or sub-fixtures. This makes selection of groups or (sub) fixtures easy and, when assigned to a playback, allows you to use sub-masters per group (see page 11 for more information on playbacks).

## **6.1** CREATING A GROUP

Add a group with the ADD button on the left. Select the newly created group and add fixtures to it by clicking on the ADD button on the right. The following dialog will pop-up.

Select fixtures in the FIXTURES or SUBS list . Click ">>" to add the selected fixtures to the group.

You can also create a group directly in the main view by recording your current fixture selection to a playback, the group is then automatically assigned to this playback. To achieve this, execute the following steps:

- 1. Make sure the programmer is cleared (press CLEAR twice)
- 2. Select fixtures
- 3. Press RECORD
- 4. Press the GO button of an empty playback

## 6.2 AUTO CLASS & AUTO MODEL

The software can automatically create groups for you. Click AUTO CLASS in the GROUP menu and the software will automatically create groups per fixture-type. Click AUTO MODEL and the software creates groups per model.

## 6.3 SUB-FIXTURES

Cuelux uses the concept of sub-fixtures. This means that some fixtures consist of multiple sub-fixtures, like a 10-channel dimmer rack is - in our terms - just one fixtures with 10 sub-fixtures. This also works for LED fixtures with multiple segments/pixels. In this manner the maximum of 48 will not be reached that quickly (you can add 48 x 10 = 480 dimmer channels). The reason behind the concept of sub-fixtures is that it makes patching easier; you only add the physical fixtures to your patch and you don't have to worry about setting starting addresses per dimmer channel, or worse, per LED segment.

## 7 CUELISTS

A lighting scene is stored in a 'Cue' and cues are stored in 'Cuelists'. Each cuelist can contain one or more cues. You can create multiple cuelists that each control a part of your show, or you can create one single cuelist that addresses all your lights.

You can either create and change cues in the main view or use the CUE menu. This chapter discusses both approaches.

## 7.1 TRACKING

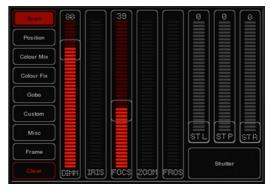

Cuelist based lighting controllers can be either tracking or non-tracking. Cuelux is a tracking console. Tracking means that in a cuelist, only changes need recording. If a light has the same value in two consecutive cues you don't need to store the second value, instead you make sure the second contains 'no' value so the first value remains unchanged through those cues.

## 7.2 CREATING CUELISTS IN THE MAIN VIEW

The fastest way to create cuelists is to do it in the Main view. Special buttons like RECORD, LOAD and DELETE are provided to make this process intuitive.

## Programmer

When recording cues, you first have to create a lighting scene which will be then stored in the cue. The Programming window is the place where you create the scene. First you select a fixture, the programming window will update to show you the capabilities of that fixtures and enables you to set the different parameters, e.g. set a dimmer level, pick a colour or gobo. You can now also deselect the fixture and select a new one; the values will be kept in the programming window's memory.

#### Clear

Any values that reside in the programming windows' memory have priority. For example you might have a cuelist running that sets a certain dimmer to 50% but if the programming window contains a dimmer level of 10% for that particular fixture, then this dimmer will be set 10%. Therefor it is important to clear the programmer once you're finished recording cues.

Press the CLEAR button once for clearing all values for the currently selected fixtures and press it twice for clearing all values, even for fixtures currently not selected.

#### **Remove attributes**

To remove an attribute from the Programmer-memory to make sure that it will not be recorded in a Cue, press the DELETE button and click the Attribute or Attribute-page in the Programmer to knock it out.

#### **Fine Adjustments**

Some fixtures support 16-bit values for controlling their attributes. To make small changes to a value in order to take use of very fine 16-bit control, you can use the CTRL key in combination with the mouse

wheel to fine tune a fader's value.

#### Flip

A moving light of the yoke type – not a scanner – is, by using its fork and head, able to reach a certain position through two different pan/tilt configurations. When the programmer is containing position values for one or more fixtures you can use the FLIP button to reach exactly the same position by using the opposite pan/tilt values.

### Record a cue

Once you've built up a scene in the programming window you can transfer the values to a new cue by following the next steps.

- Press the RECORD button
- Press the GO button of an empty playback

This will create a new cuelist with one cue that contains the scene from the programmer. The cuelist is automatically assigned to the playback. You can repeat this process to add new cues to the cuelist.

## Edit a Cue

To edit the cue, first make sure the cue is outputted by activating the cuelist and stepping to the cue you want to edit using the PLAY button. Select the fixtures you want to change and change the

attributes in the Programmer. You can also add other attributes by changing the attributes for the selected fixtures. Other fixtures can also be added: Select them and change the values you would like to store in the cue.

Press RECORD and click on the PLAY button of the cuelist where the cue you want to edit is active. A window will popup, asking you what to do. Choose MERGE to merge the active information in the Programmer with the cue.

Q	Insert
RECORD METHO	Replace
ECORD	Merge
R	Cancel

## Remove values or fixtures from a cue

To remove values or fixtures from a cue, we're going to load the complete cue into the programmer, make the changes, and store the programmer back into the cue by replacing the old information.

Make sure the cue is active by activating the cuelist and stepping to the cue you want to edit using the PLAY button.

Load the cue into the Programmer by pressing LOAD and clicking on the PLAY button of the cuelist. All information in the current cue is now loaded into the Programmer.

To remove a fixture from the Programmer, select the fixture and press CLEAR in the Programmer once. To remove one or more attributes, select the fixtures, press DELETE and click on the attribute or the attribute-page; this action will delete the attribute or the complete attribute page from the programmer.

To store the Programmer back into the cue, press RECORD and click the PLAY button of the cuelist where the cue you want to edit is active. In the pop-up window, choose REPLACE to replace the cue with the information in the Programmer.

## 7.3 MODIFYING A CUELIST VIA THE MENU

Next to working in the Main view, you can also edit cuelists via the CUE menu. Although you can create a new cuelist in the CUE menu, the menu is more setup for modifying cuelists once created in the Main view.

To change an existing cuelist, open the CUE menu. Select a Cuelist and click EDIT to open the Cuelist editor. Here you can edit the properties of the CUELIST and the individual cues.

The following properties can be set for the cuelist:

## Chase

When CHASE is enabled, the cuelist will no longer follow the cues' timings and conditions. The cuelist will be played back as a chase. The cross-fade can be changed using the ATTAK slider. The speed of the chase is linked to the main Chase tempo, which can be found at the bottom left of the Cuelux window. All cuelists set to CHASE will run synchronous to this tempo.

In the Cuelist Editor, you can also specify a tempo divider for the chase.

1/1: Chase will step further on every beat of the main chase tempo.

1/2: Chase will step further once in every 2 beats of the main chase tempo.

1/4: Chase will step further once in every 4 beats of the main chase tempo

Etc.

## Speed

Speed controls the playback speed of the cuelist. 50% reflects normal playback speed, with the programmed timing per cue. Changing the playback speed will scale the timing for all cues in the cuelist.

## MODIFYING A CUE VIA THE MENU

The following properties can be set per cue:

#### Label

The label is the name of the cue for your reference.

#### Condition

The condition specifies when the cue will be triggered. There are 3 possible Conditions:

	Targets	CUE	POSITION	LABEL	CONDITION	DELAY	FADE IN	FADE OUT		Add
					Halt			00:02.00	ſ	Remove
ŝ	Cues		00:00.00	mauve	Halt	00:00.00		00:02.00		
COLOURS	Loop				Halt			00:02.00		
COL			00:00.00	oragne	Halt	00:00.00		00:02.00		
	Chase								ſ	
ſ	RELEASE									Close

Halt	The cue will be triggered when you press the GO button.
Follow	The cue will be triggered as soon as the previous cue has finished fading.
Wait	The cue will be triggered autocratically after the previous cue has been triggered.

#### **Cue Timing**

To explain the different timings in combination with the Cue Condition, see the following diagram:

#### Delay

The delay time (in seconds) is the time between the cue being triggered, and the cue actually starting to fade.

#### Fade In

The Fade In time (in seconds) is the fade time for all dimmers fading in (dimmer values going UP) in the cue and all other fading attributes (e.g. colour mix, position).

#### Fade Out

The Fade Out time (in seconds) is the fade time for all dimmers fading out (dimmer values going DOWN) in the cue.

Click and drag to select multiple properties for multiple cues, e.g. fade in for multiple cues or delay & fade in for multiple cues

### Edit

The values in a cue can also be edited in the Cue Editor. Select a Cue and click EDIT.

#### Insert

Use Insert to add an attribute to the cue.

#### Delete

Use Delete to remove an attribute from the cue. The attribute's column will still show until it is removed from every cue.

#### Change

Select one or multiple values and click Change to change the value.

## WIZARD

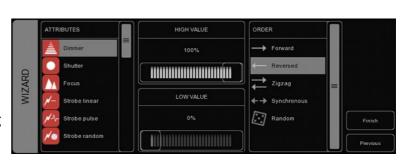

The wizard can automatically create typical cuelists that might have taken quite a while to program if done by hand.

To use the generated cuelist, it still has to be assigned to a playback fader or button. See page 11 for instructions.

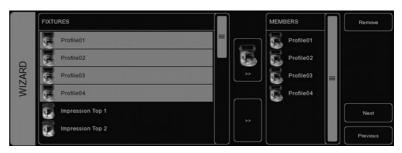

## Chase

The wizard can create a chase over multiple fixtures. You can select any of the attributes that is supported by the fixtures you have selected. The wizard also offers different orders in which the chase can run e.g. Forward, Reverse, Zig Zag, Synchronous or Random.

## **Test Sequence**

The wizard can make you a cuelist that contains a sequence of steps for testing fixtures. Based on the personality file of the selected fixture it will generate cues for each attribute the fixture features. It is advised to create one test sequence per type of fixture.

## 8 STACKLISTS

Stacks can be used to combine multiple cuelists into one effect. You could use it on-the-fly to start multiple cuelists in sync, or you can program a stacklist and assign it to a playback.

## 8.1 USING STACKS LIVE

To trigger multiple playbacks at the same time during live operating, press the STACK button and click on the PLAY buttons of the playbacks you want to trigger at the same time. As soon as you press STACK again, the selected playbacks will trigger simultaniously.

## 8.2 Recording stacklists

If you want to repeatedly trigger the same playbacks, recording to a stack in a stacklist comes in handy. Press the STACK button. Click on the PLAY buttons of the playbacks you want to trigger at the same time and press RECORD. Now click on the PLAY button of an empty playback fader or button. A new stacklist will be created containing the new stack. You can record multiple stacks on the same playback fader or button.

## 8.3 EDIT A STACKLIST

To edit a stacklist, go to the Stack menu or double-click on the Playback Indicator above the playback button or playback fader where the stacklist is recorded.

The Stacklist has several properties you can change.

#### Loop

This check box controls whether the stacklist will release after running the last stack or whether it will go back to the first stack and keep looping until it is released manually.

#### Label

You can give each stack a label for your own reference.

#### Condition

Similar to making cues, you can set conditions for each stack. Although for stacks only 'Halt' and 'Follow' are supported.

#### Delay

A delay time can be set between triggering the stack and when the cuelists will become active.

## **9 G**LOBALS

On the main screen of Cuelux, you'll notice 3 GLOBALS for FOG, STROBE and BLINDER. These buttons can be instantly used without programming individual cuelists. When patching fixtures, the software automatically recognizes strobes and fog generators and allocates them directly.

## Fog

All fog machines in the configuration will be activated for as long as you keep the button pressed.

TIP: Would you like to use the FOG global only for a selection of fog machines? Create a group, rename it "fog" and add the fog machines of your choice to that group to have them responding to the FOG global.

#### Strobe

All strobes in the configuration will strobe while keeping the button pressed

TIP: Need more strobe-power? Create a group, rename it "strobe" and add fixtures to that group. Don't forget to add the strobes manually to the strobe-group too!

#### Blinder

All fixtures in the group "blinder" will flash at 100% intensity as long as the button is pressed. Because Cuelux doesn't know to which dimmer-channels the blinders have been connected to, you have to create a group with the name "blinder" and include the dimmer-channels or fixtures you wish to use.

## **10 TEMPO CONTROL**

All Cuelists with property CHASE enabled, are synced to the Tempo. You can find the controls for the Tempo on the bottom left of the Cuelux window .

Using the TEMPO button below the tempo display, you can tap to the music to change the tempo in Cuelux. You can also click the tempo display and drag up (tempo UP) or to the right (tempo DOWN).

#### Break

Click the BREAK button below the tempo display to pause all chases. Click again to continue all chases.

#### **MIDI Clock**

When the MIDI Input device you've selected in the MIDI Options (see chapter "MIDI Controllers") sends out MIDI Clock messages, the Tempo will be automatically locked to the MIDI Clock tempo. This allows exact tempo matching when controlling Cuelux from sequencer software for example at a concert.

In order for the tempo to be controlled by the MIDI Clock, the display should be set to 'midi' mode. Press the TEMPO button for more than one second to switch to 'midi' mode. Press the TEMPO again to switch back to 'manual' mode.

Illustration 5: MIDI mode

## 11 Нот-кеуз

Depending the current view, menu or dialog, the most used mouse operations are also assigned to the keyboard's keys. Using these 'hot-keys' can speed up your tasks significantly. Below is a summary of the major views in Cuelux.

#### Main view

F1-F8: playback button go F9-F10: playback button bank down-up 1-8: playback fader go Q-I: playback fader flash Page down/up: playback fader bank down-up Home: Page 1-24 End: Page 25-48 /\*-: globals pause/break: break ctrl+S: stack backspace: release INS: record ctrl+L: load **DEL:** delete Tab: tempo tap left/right: selection left/right

## **12 MIDI C**ONTROLLERS MAPPINGS

Cuelux supports various MIDI control surfaces. The buttons and faders on those controllers are assigned to features in the Cuelux User-interface in a pre-defined midi-map. The following diagrams illustrate those assignments.

## **Generic Midi-map**

Next to the hardware specific midi-maps, Cuelux also offers a generic midi-map in which all the software functions that can be controlled through MIDI are assigned to Note or Control Change message. This midi-map is intended for use with external MIDI software like sequencers or DAWs.

## **Elation MIDIcon**

The Elation MIDIcon is supported Plug & Play.

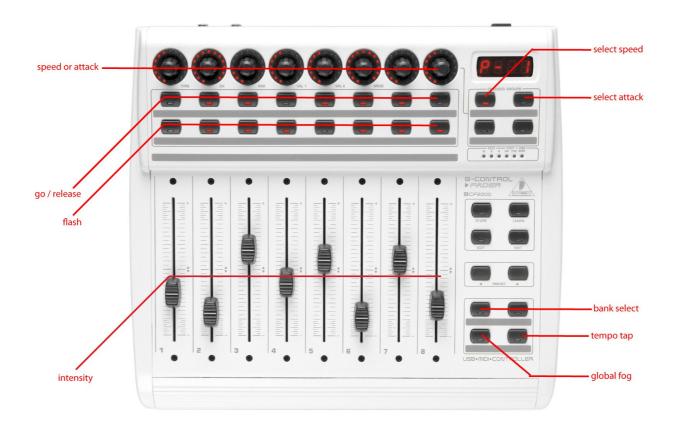

### Behringer BCF-2000

The Behringer BCF-2000 is supported Plug & Play: However, for optimal use we've included a Sysex-file that can either be found in the "Program Files/Visual Productions/Cuelux/Sysex/" folder on Windows systems, or it can be obtained at the forum (http://forum.visualproductions.nl).

The Sysex file can be uploaded to the BCF-2000 using one of the following (free) tools:

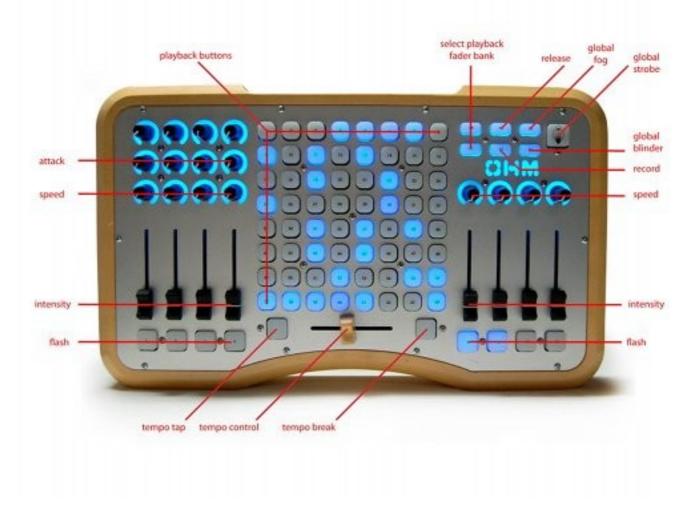

- Midi-OX for Windows: http://www.midiox.com
- SyEx Librarian for Mac OS X: http://www.snoize.com/SysExLibrarian/

After sending the Sysex file to the BCF-2000, please notice that the received preset is in a "temporary memory". If you switch off the BCF-2000, the preset will be lost. When you've received the preset on the BCF-2000, press STORE, use the PRESET buttons to choose a preset number for storing the preset, and press STORE again. The preset will be saved in the BCF-2000.

## Livid Instruments Ohm64

The Livid Instruments Ohm64 is supported Plug & Play.

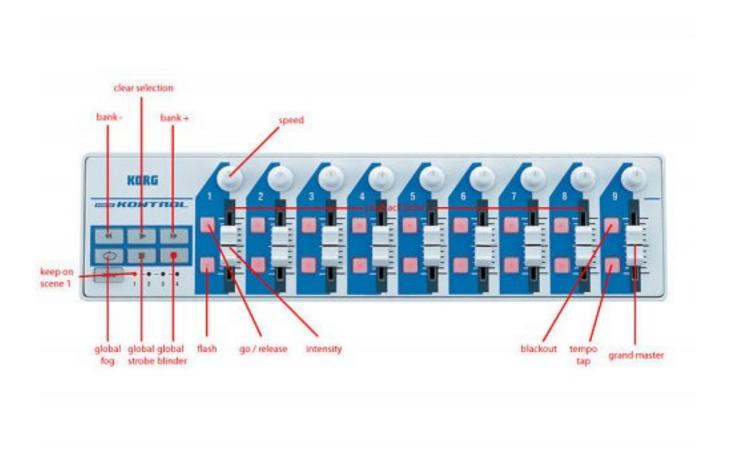

## Novation Launchpad

The Novation Launchpad is supported Plug & Play.

## Korg nanoKontrol

The Korg nanoKontrol is supported Plug & Play.

## 13 PHONE REMOTE

This chapter explains, step-by-step, how to set up your iPhone to use the Remote function as described on page 7.

#### Step 1

Make sure the computer running Cuelux and your iPhone are connected via WIFI (for example via a simple WIFI router as displayed).

#### Step 2

Step 3

In Cuelux, go to Options -> Remote and turn on ENABLE REMOTE CONTROL.

On your iPhone, browse to the address displayed in Cuelux.

#### **Enable the Cuelux Remote**

#### Browse to the Cuelux Remote on the iPhone

**Step 4** Finished!

## **14 Personality Files**

Most fixtures differ in the way how they are controlled by DMX. Cuelux reads 'personality files' (sometimes referred to as 'profiles') to determine a fixture's DMX traits. When you patch a fixture you need to choose your fixture from a list of supported personalities (as described on page 9). This chapter describes how to obtain additional personality files in case your fixture is not yet present in our list.

## **14.1 G**ENERIC

Some types of fixtures typical have identical DMX traits. These common fixtures (e.g. Dimmers, fog generators, RGB LED fixtures) are represented in the 'Generic' collection in our library.

## **14.2 R**EQUEST NEW PERSONALITIES

Visual Productions provides a free-of-charge service for creating personality files on request. Please make the request on the Visual Productions Forum (http://forum.visualproductions.nl) and include a link to the user-manual or DMX- chart of your fixture.

When you receive the file from Visual Productions it needs to be copied into the following location, before starting up Cuelux:

Windows XP	C:\Documents and Settings\[username]\My Documents\Visual Productions\Common\Factory
Windows Vista	C:\Users\[username]\Documents\Visual Productions\Common\Factory
Mac OS X	/Users/[username]/Visual Productions/Common/Factory
Ubuntu Linux	/home/[username]/Visual Productions/Common/Factory

## 14.3 CREATE YOUR OWN

Sometimes it is better to create your own personality file, maybe you need it urgently and you're outside office hours. Or perhaps you don't have a manual available so you would need to create a file through trial-and-error, testing it on the physical fixture.

For any of these cases we supply an editor for creating the personalities yourself; the Personality Builder. It is an external tool for creating and modifying the personality files used by Cuelux. The Builder is supplied free-of-charge for all Cuelux users and can be downloaded from http://www.cuelux.com/downloads.

For a detailed description of this editor please read from page 31.

## **15 PERSONALITY BUILDER**

The Personality Builder is a software program that you can use to create or modify the personality files used by Cuelux. It is available on Mac and Windows and you can download it free of charge from http://www.cuelux.com/downloads.

This chapter will describe the Personality Builder software by guiding you through the software. This text is written for Builder version 1.01.6.

## 15.1 Overview

The software is built in two sections, the Factory section and the User section.

Within the factory section nothing can be changed, these are the default personality files as supplied by Visual Productions. The user section contains all the User Manufacturers which can be modified with the Personality Builder.

	Factory	manufacturers	Us	er manufacturers
PERSONALITY				
FACTORY NAMERACTURES		USER REVERACTORERS		A.00
Diversitianics		Transformer/D1		
Dotret				Reten

Fa	actory models	]		User models

## 15.2 DMX diagram

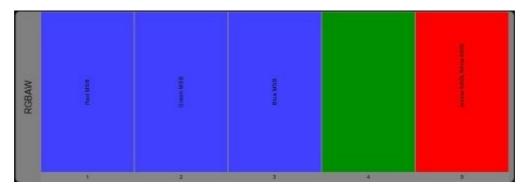

In the DMX diagram you can see what channels are being used and which are not.

You are also able to see if there is any DMX overlap; some fixtures require a DMX overlap, whilst other times this overlap would mean that there is an error.

## Legend

Green: represents empty spaces in a DMX channel

- Blue: represents used space in a DMX channel
- Red: represents an overlap

## **15.3 M**ANAGING PERSONALITIES

Although you cannot edit Factory Manufacturers directly, you can copy them to your User Manufacturers and then change them from here.

#### **Duplicate Factory Manufacturers**

If you would like to add a new model to a Factory Manufacturer you have to copy the manufacturer to the User Manufacturers.

To do so, select the Factory Manufacturer and click on the >>.

Since the manufacturer is now in the User Manufacturers you are able to change and add models.

#### **Duplicate Factory Models**

It is also possible to add a Factory Model to your User Manufacturers.

Select the User Manufacturer that you would like to use, and then select the Factory Model that you would like to copy.

Press the >> next to the models section to copy the Factory Model to the User Models.

Now you are able to change the existing model without having to create a new one from scratch.

#### Creating a new manufacturer

To add a new manufacturer to your personality library, click on the ADD button next to the "User Manufacturer" section.

This will add a manufacturer named "Manufacturero1". To rename select this and click the RENAME

#### button.

#### Creating a new model

Select a User Manufacturer and click on the ADD button next to the "User Models" section to add a new model.

To rename the model, click RENAME and enter the new name of this fixture.

#### Saving the personality file

When you have finished editing a personality you can press the save button next to the User Manufacturers section, this will save the manufacturer to your disc.

When a manufacturers name has a \* in front of it, it means that it has been modified and that it needs to be saved.

## 15.4 MODEL PROPERTIES

In the main overview, select the model that you want to edit and click PROPERTIES.

	GASS			][
	Vike spot	A1 10	incrie)	C1 102
	Elizio Fra Corrar Director Channel	Angla Pan	360	Cimp
MODEL PROPERTIES	Convertional Convertional Convertional Convertional Convertional Convertional Convertional	AngleTit	50	Ctext
	Prod San David David	THE Adapte Vikidity	Automatic	Chang
	Fran Lat Weithpack	Mutta Magaing	Unknown	Chang

This dialog allows you to enter the following properties:

#### Alias

The Alias field defines a default name when patching this model in Cuelux. If you leave this field blank it will use the name of the model instead.

#### Angle Pan

Maximum pan movement, when the light is not a moving light you do not need to change this.

#### Angle Tilt

Maximum tilt movement, when the light is not a moving light you do not need to change this.

#### Matrix Width

Width of a matrix; by setting the width Cuelux will calculate the height of the matrix according to the number of sub-fixtures.

#### **Matrix Mapping**

If the model has multiple subs and is used for matrix control, then here you can fill in the order in which the subs are layed out.

#### Class

The Class of a model is set to "Automatic" by default; Cuelux determines what type of fixture it is and shows the relating icon. You can override this by manually selecting a class.

## 15.5 Editing Models

In the main overview, select the model that you want to edit and click "Edit".

## Modes

Please create modes if the fixture has multiple modes in which it can operate.

When you need to add multiple modes you can define the parts that all modes have in common in the "[Main]" mode.

For example the Clay Paky Mini Scan HP3, this model has two modes, an 8-bit mode and a 16-bit mode. Please take a look at the picture below.

## Subs

Some fixtures use subs to control a part of the whole fixture, a dimmer for example has multiple Subs. Each Sub can have its own part and can be individually selected and programmed in Cuelux.

For example the Elation Cyber Pak: this fixture has 4 different subs which all have their own dimmer.

### Parts

To start adding Parts to your model click ADD on the parts section. A list with all the available parts will come up, select the part that you would like to add and click Ok.

38

## 😳 Position

Add a position part if a fixture features pan & tilt movement.

Select the element from the AVAILABLE list and click on the >> button. Once included in the list on the right, you can change the CHANNEL

Once the element is added to the personality file you can change the

CHANNEL and the RANGE values of the element.

#### MSB/LSB

The acronyms MSB (Most Significant Byte) and LSB (Least Significant Byte) are frequently used when creating new personality files.

MSB: Controls the 8-bit operations of the fixture (sometimes referred to as "Coarse").

LSB: Controls the 16-bit operations of the fixture, 16-bit is used for the fine adjustments. It can only be used if the fixture supports 16-bit (sometimes referred to as "Fine"). When a fixture supports 16-bit controls, you have to define both MSB and LSB!

## 💋 Shutter

In the shutter part you can add a shutter closed and three different strobe functions.

If no function is set by Cuelux, so no Closed shutter, Strobe Linear, etc, then the channel is set to its 'idle' value. You do not need to define an idle value in the Builder; Cuelux will automatically choose a value that is not used for anything else. Please note that you can use the RESERVED range to prevent Cuelux from using certain values as idle.

Several other parts use idle values as well when not activated, like Reset, Lamp, Display, etc. Therefore these parts will also feature the reserved ranges.

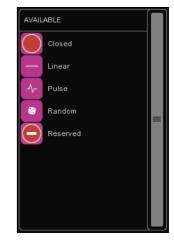

## 🛓 Dimmer Iris 🚺 Focus

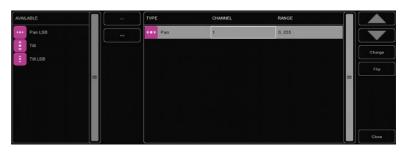

The Dimmer, Iris, Focus and Zoom have Control and Control LSB ranges that can be added.

When setting the Control range for the Iris part, please make sure that the minimal value represents an open aperture and the maximum value represents iris closed.

## Srost

Frost has two modes of operation, some fixtures use the Control (LSB) ranges while others only have an on/off option for the frost function.

## 🕙 ColourMix

The ColourMix part can hold the RGB, CMY, White and Amber ranges. To quickly add RGB to the fixture you can use the ADD RGB button.

	][]	ТҮРЕ	CHANNEL	RANGE		
Red LSB		🮑 Red		0,255		
Green LS8		Green				Charge
🕝 Blue LSB		🕜 Blue				
Cyan						Пір
Cyan LSB						
Magenta						
Magenta LSB						
Yellow					r i	
						Close

## 😳 ColourFix

When a fixture has a wheel with fixed colours, you can use the ColourFix to define the slots in the colour wheel. You would need to add slots for each colour position. Up to three ColourFix parts are supported by the Builder.

Select a slot and click CHANGE. Now you can pick the appropriate colour from the list of colour libraries. Quite a few fixtures feature 'split colours'; a position on the wheel where two halves of a colour are visibile (e.g. Elation Power Spot 575). The Builder supports up to 4 different colours per slot.

AVAILABLE		COLOUR/TYPE COLOUR 2 COLOUR 3 COLOUR 4	CHN RANGE	Add Slot
3 Random	**	CLTE	7 0,6	Remove Slot
Function Manual		CLTE CLROW	7 7,13	
Function Scroll		clrow	7 14, 20	
B Function Random		CUROW CURGE	7 21, 27	Charge
		CLRGE	7 28,34	
		CLRGE CLR_RED	7 35, 41	
		CLR_RED	7 42,48	
			7 49,55	

Next to adding slots you can also add ranges for scroll, random and several function ranges. These function ranges are explained on page 41.

To change the range of a colour, select the range and click change. You can either set the range by typing or by using the up/down controls. The fastest way, however, is to type the minimum value, press enter, and type the maximum value, press enter again to close the dialog.

When you change the channel number of a colour slot, all colour slots will automatically get the same channel.

## 🚱 Gobo

Please add a Gobo part for each gobo wheel in the fixture, up to three gobo parts are supported. Then add a slot for each gobo on the wheel, including open-gobo, and set its range.

You can pick an image for each gobo, if you don't know the actual gobo patterns then it is best to stick with the numbered images.

Functions like shake, rotation and index are sometimes controlled by another DMX channel; in this case add a range (e.g. shake) to the part as well. Other

AVAILABLE		SLOT	TYPE	CHN	DEFAULT	SHAKE		ROT. COW SCROLL	
Shake			open						Remove Slot
Function Manual		0	eclipse			195, 209	51, 51		
Cunction Scroll		×	fat_bar			180, 194	59, 59	59, 59	عم
Function Random		*	fan_4blades		16, 16	165, 179	66, 66	66, 66	
💭 Function Rotation CW		\$	happy_yins			150, 164			Flip
Function Rotation CCW		$\triangleright$	hvisted_triangle		26, 26	135, 149	82, 82	82,82	Clear
Sunction Shake		浠	splash			120, 134	90, 90	90, 90	
G Function Scr Rotation CW		5	aflobet		36,36	105, 119	97, 97	97, 97	

times, shake and rotation are set on the same DMX channel as the gobo selection; in this case set an extra range per slot.

## 싱 Prism

Add a prism part if your fixture has a wheel with prisms. Prisms are identified by their number of facets. The most typical prism has three facets, select a one-facet prism for open or no-prism.

## 🝸 Lamp

To strike the lamp via DMX you can use the Lamp control. You can define an On and an Off range for the lamp.

Some fixtures require the lamp on/off control to hold for a specific amount of time. This can be set in the "Time" section of the Lamp part. If the fixtures manual indicates the value has to be set "for at least 3 seconds" then you can just enter a time of 3; Cuelux automatically adds an extra second.

## 🚥 Reset

The fixture reset can be defined in the Reset part. This part only has an On property that you can set.

Most fixtures require the reset to be pressed for an amount of time. If the fixtures manual indicates the value has to be set "for at least 3 seconds" then you can just enter a time of 3; Cuelux automatically adds an extra second.

## 🖌 Fog

When you are creating a personality file for a fog machine or hazer you can use the fog attribute.

When using the Fog attribute, the global "Fog" button will be activated within Cuelux.

If the fog generator also has a control channel for operating the fan then we recommend using a "custom" part for this feature. Customs are described further in this chapter.

## 🕷 LAD

The LAD (Laser Aiming Device) control can be switched On by defining an On value.

The High End Systems Technobeam has a LAD.

## 🗾 Stand Alone

This can be used if a fixture has a stand-alone or sound activated mode.

This attribute functions as a switch; you can set an On value.

## 🚥 Display

This is used to switch off the display of your fixture during a show.

## Barrel

The barrel can have two controls defined, Rotate CW and Rotate CCW.

Two examples of fixtures with a barrel:

Martin Destroyer or a Martin Wizard extreme.

## 💷 Macro

Use the Macro part for controlling internal "programs" or "macros".

You can add "On" for each Macro.

#### Frame

Some fixtures have DMX controlled shutter blades (sometimes also called "framing"); use the Frame part to control this function.

For example the Martin MAC 2000 Performance features framing.

## Custom

When a function is not defined in one of the above parts, you can use a Custom.

When defining a Custom, you can choose a name for the Custom which will be displayed under the fader in Cuelux.

Tip: Please keep in mind that the space is limited when choosing a name for a Custom, we recommend 4 characters. For example "ANIM" for "Animation Wheel"

You can add up to 8 custom parts.

## Parked

Parked can be used to permanently keep a channel in a specific value.

For example: some fixtures have a "control by DMX" setting that needs to be a value in order to control the fixture over DMX. You can set this by creating a Parked with a fixed value.

A fixed value can be created by setting the same value for the minimum and the maximum.

## Functions

When you are making a model that requires a channel to be at a specific value for a specific function, you can use the "Function ..." attribute.

For example, if you need to define a gobo-scroll with channel 6 and you need channel 5 to be at a specific value to be able to use this scroll, you can create a new "Function Scroll" and give it the settings that are needed on channel 5.

All you need to do now is create the scroll as usual.

When you are using the scroll, Cuelux makes sure that channel 5 is set correctly before applying the scroll to your fixture.

For example the gobo wheel of a High End Systems Studio Spot 575 CMY. (see picture below)

SLOT/TYPE	CHN	DEFAULT	SHAKE	ROT. CW	ROT. CCW	SCROLL	$\square$
Function Manual	9	0, 0					
Functioion CW		16, 16					
Function CCW		16, 16					
Function Scroll		48, 48					
Functandom		80, 80					
	11	4, 255					
Random	11	4, 255					
Rotate CW	11	4, 255					

## 15.6 Using Personalities

Once created you can start using your new personality file yourself or share it with others.

## **Uploading to Visual Productions**

Please consider sending us your work after you have tested your personality file. This way we can include your personality in the factory library for the next release. We appreciate your help making this personality library the largest and most reliable in our industry.

You can send your models to us using the "Send" button in the main overview.

## Sending per e-mail

If you would like to send a personality file to a customer or other user you can add the personality file as an attachment to an e-mail.

All personality files that you have created can be found in:

Windows XP	C:\Documents and Settings\[username]\My Documents\Visual Productions\Common\User
Windows Vista	C:\Users\[username]\Documents\Visual Productions\Common\User
Mac OS X	/Users/[username]/Visual Productions/Common/User
Ubuntu Linux	/home/[username]/Visual Productions/Common/User

## Selecting in Cuelux

When you have made your own personality file and saved it to disk, you can restart Cuelux to find your new file at the very bottom of the Manufacturers list in Patch menu's ADD dialog.

All User Manufacturers will begin with the prefix [User].
